High quality, beautiful, timeless ... Clinker bricks, slips and pavers are made of natural materials which harmonize with the surrounding landscape. They can be a stylish addition to an avant-garde interior or a warm finish to a cosy house. The customers appreciate their durability, beautiful colours and textures, while the designers value their unlimited design possibilities.

NATURALLY BEAUTIFUL CLINKER

Etna, Calau 45 (Etna N)

When building a house or arranging a flat, we think about the final result and atmosphere we would like to create. We do our best to design ideal functional solutions that would match our lifestyle and standards. Selection of proper materials is also an important issue. They should be durable, natural and environmentally-friendly, but they should also inspire us on an everyday basis with their aesthetics. The CRH Klinkier - Clay Solutions clinker bricks and slips are exactly like that. The range of available colours and textures is very wide, which is why we present our products as part of specially selected collections. We believe that mere watching of them will evoke in you wonderful memories and associations ranging from sunny beaches, fresh and crystal clear streams, to the warmth of a fireplace. Choosing products from your favourite collection will surely help you create in your house, interior or garden an individual and unique atmosphere. The number of applications is virtually infinite, the more so because our products are used increasingly more frequently not only in facades or gardens, but also in original decorations of bathrooms, kitchens or living rooms. Our products perfectly suit both a subdued and warm rustic style and a modern minimalism. They can cover entire surfaces or be a single, original decorative element. Depending on the concept, they may calmly blend in with the background or be an eccentric accent. We hope that our products will stir your imagination and help you make your dreams come true.

CRH Klinkier - Clay Solutions

10/11

WHY CHOOSE CLINKER?

- It guarantees a durable and elegant facade for many years to come. It doesn't require renovations or repairs, as the low absorbability of bricks and slips prevents the dirt from setting.
- It increases the value of investment. The cost of clinker slips and bricks used for the facade accounts only for a few percent of total costs of the building. They considerably improve the aesthetics of the building and its surroundings
- It is fire resistant
- It is completely frost proof and resistant to chemical and biological corrosion, as well as to fungi, algae and moss that may cause allergy.
- It has high mechanical strength
- It provides perfect acoustic insulation for cavity walls (the insulation factor: 40-50 dB).
- It ensures a proper micro-climate in summer and thermal confort in winter (for cavity walls).
- It is environmentally friendly made only of clay and sand.
- It is available in a wide variety of colours of bricks, slips, pavers, and a full range of shaped clinker bricks.
- It can be easily combined with other materials, such as wood, glass or aluminium.

FACADES – clinker or plaster?

Clinker bricks / slips Material	Plaster
Ceramics – selected, high-quality clay fired at 1100 °C. Ecological material – natural and durable.	 Mixture of filler and texture aggregates connected (depending on the type of plaster) with one of the following binding materials: mineral: cement, calcareous binders or their mixture, silicon: organosilicon binders with addition of water-based acrylic resin dispersion, silicate: potassium water glass, acrylic: organic binders, mainly acrylic-styrene binders.
Resistance to mechanical damage	
Very high – a curtain wall made of brick protects the remaining layers against adverse weather conditions and mechanical dama- ge. It is also resistant to e.g. hailstorm. A facade made of clinker bricks is massive (115–120 mm thick), so it is resistant to damage. One can save on repairs.	Poor or no resistance to mechanical damage – plaster is not resistant to mechanical damage because of its small thickness (1–3 mm). The strength of plaster is mainly based on the reinforcing layer made of acrylic mesh. Plaster facades are not resistant to hailstorm.
Resistance to staining	
Resistant – a compact and solid structure (ceramals) guarantees a very tight surface of extremely low absorbability (3–4%), thanks to which it is completely washable. Using an anti-graffiti cleaner one can even remove graffiti from a clinker facade. High resistan- ce to staining and easy maintenance.	Poor or no resistance to staining – because of its porous structu- re. Mineral plasters are highly susceptible to structural staining, because of their coarse grain structure. The resistance of acrylic plasters is quite similar because of their thermoplasticity and electrification of resins. Minimum resistance to staining is only characteristic of silicate and silicon plasters. Plaster is not resistant to staining – stained surface needs to be painted once again.
Colour	
Durable and resistant to fading – uniform colour across the entire material. A wide selection of colours is obtained by using various clays, which fire naturally into several colours without any artifi- cial additives or dyes. Life-long colour warranty.	Non-durable and non-resistant to fading – only white colour is natural. The other colours are obtained by adding artificial dyes, e.g. iron oxides or phthalocyanines.
Renovation	
No – clinker products do not need to be renovated – one can save time and money.	Yes – which is time-consuming and expensive.
Fire resistance	
Fire-proof – the brick is "born in fire" – it is fired at high tempe- rature of 1100 °C. Fire resistance class (REI) = 120 minutes. The clinker wall is twice as safe as a plaster facade.	 Non-flammable/ flammable – depending on the type of plaster. Mineral plasters – cement, calcareous binders or their mixture: mineral, silicon, silicate plasters: non-flammable, acrylic – flammable. Fire resistance class (REI) = 60 minutes.
Resistance to weak acids	
Resistant – it is a natural feature of ceramics, because during the firing process the clay used to produce clinker changes its structure into a non-reactive form. Therefore, it becomes resistant to acids (e.g. acid rains), detergents and other caustic agents. Easy maintenance.	Not resistant – plasters due to their structure and chemical composition (applied aggregate and binding material) are not resistant to acids and acid solutions. In order to protect the surface from acid the plaster needs to be coated with epoxide resin.

Prepared on the basis of: PN-EN 771-1 "Requirements concerning masonry elements. Part 1: Ceramic masonry elements", PN-EN 14411 "Ceramic slips and panels – definitions, classification, characteristics and marking", PN-EN 13914 "Design, preparation and manufacture of outdoor and indoor plasters. Part 1: Outdoor plasters", product data sheets, documentation of the manufacturers of bricks, slips and facade plasters, as well as publications of research institution staff.

FACADES and INTERIORS – the rules of proper performance

Remember to

- calculate well the amount of material to be used to perform the works, allowing for a 3–5% reserve, before placing your order,
- order products from the same production batch; ceramic products are natural materials and particular batches may slightly vary in shades and sizes,
- if you order clinker products from different batches, check whether the bricks / slips are of the same shade and size. If they are not, you should carefully mix the products from different pallets to make the colour of the facade uniform,
- measure the facade before commencing the masonry works to avoid unnecessary cutting,
- mix bricks / slips from different pallets to achieve the effect of "living", natural facade, while laying clinker products from the same batch.

Storage

- clinker bricks stored on a building site should not be exposed to any contamination, such as binding materials, mortar or concrete,
- clinker slips should be stored in their original packaging in an area where they will not be exposed to damp, dirt or mechanical damage.

Preparing the mortar / adhesive

- check the water absorption properties of the purchased bricks to choose the adequate type of mortar,
- use pre-mixed masonry mortars for laying the bricks. The preparation of mortar involves adding a specified amount of water to the dry mix. Always follow the manufacturer's instructions given on the packaging. Do not add any extra water to the mortar during the works, otherwise differences in mortar shades may occur,
- for slip laying we recommend ready-made flexible adhesives designed for external ceramic slips. When selecting the adhesive, take into account the type of the substrate, the working conditions and the surface preparation method.

Brick and slip laying

 when laying the bricks / slips, take the bricks / slips from several pallets or packs to minimize slight colour differences between

Rules of proper facade making with the use of clinker slips

In the case of already existing buildings, where it is not possible to support a curtain wall made of clinker bricks due to a lack of proper foundation (which happens quite often), when one wants to make a tough, durable and aesthetic facade – one can use clinker slips. Clinker slips can be used in combination with any building material and insulation made of foamed polystyrene or wool. Clinker slips fixed on the facade are deceptively similar to traditional bricks. They are an ideal solution for anyone looking particular production batches and to make the colour of the facade uniform,

- use clean tools, when laying the bricks / slips. Keep the workplace in good order,
- clean immediately any dirt, including mortar staining, with a dry soft brush or with clean water and a damp sponge to prevent it from caking,
- do not lay any bricks or slips during rain or frost. When it rains, the water washes out the mortar from joints, causing difficult to remove cement stains. When there's frost, the water simply freezes in the mortar instead of setting it, which reduces the strength and durability of the joint,
- protect a recently constructed slip wall / facade against rain for 14 days with a protective cover that allows a free air flow.
 If the wall / facade is not protected, the rain may wash out the newly made joint onto the brick faces, whereas extreme heat or excessive exposure to sunlight may cause loss of too much moisture and excessive dryness of the mortar, which reduces the strength and durability of the joint.

Joint formation

- generally the same mortar can be used for building and pointing the brick wall, provided that it is a mortar for bricklaying and pointing. The consistency of the mortar for pointing bricks and slips should resemble that of damp soil,
- for pointing bricks and slips, use a pointing trowel, the width of which corresponds to the width of the joint,
- do not spread the pointing mortar over the surface of the bricks / slips, as this may cause difficult or impossible to remove stains,
- point the bricks / slips in a downward direction. First form the horizontal joints and then the vertical ones.

Facade cleaning

- remove immediately any staining on the face caused by masoning, bonding or pointing, using a dry method,
- do not allow the mortar to set on the face of the brick / slip,
- remove any excess of adhesive pressed out from the slip into spaces between the slips to allow application of the pointing mortar.

for a simple and proven way of house finish, renovation or refurbishment. A facade cladding made of clinker slips is first fixed to the wall with a highly flexible, frost-proof slip adhesives and then pointed with a mortar for clinker pointing. The facade slips are made of material which perfectly imitates the brick – both in terms of the wall appearance and its resistance to staining (for many years one does not have to incur any renovation or painting costs, which is usually the case in plaster facades). If you want to enjoy the beauty of a facade made of slips for many years to come, prepare the substrate well and make the facade right.

FACADES and INTERIORS – slip laying

There are two methods of laying clinker and facade slips on the outside:

- on the insulated brickwork element (composite wall),
- on the non-insulated brickwork element (single wall, low wall, etc.).

Each case requires a slightly different preparation of the surface and application of other materials.

Slips on the wall insulated with foamed polystyrene

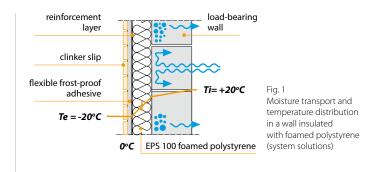

As far as foamed polystyrene is concerned (Fig. 1), we recommended using EPS100 (former name FS 20) with a higher abrasion resistance. The substrate on which the thermal insulation is put, additionally burdened with slip cladding, must have a high load carrying capacity. Because of its high diffusion resistance, foamed polystyrene is impermeable to steam, retaining it on the internal (warm) side of the wall. As a result, the steam flow is disturbed (as in the case of any wall insulated with foamed polystyrene), but as this process always occurs in above-zero temperatures, it does not affect the durability of the clinker cladding. The steam accumulated inside the load-bearing wall returns to the inside of the room, where it is disposed of by a ventilation system.

Slips on the wall insulated with mineral wool

When the slips are laid on wool (Fig. 2, 3), we recommend using facade wool. This technology is based on wool's natural permeability to steam. The steam, having permeated through the loadbearing wall and the wool layer, finally gets outside through the joints between the slips. This flow is not as free as in the case of the cavity wall with clinker brick facade, however it suffices to ensure a proper functioning of the wall (the total area of the joints constitutes as much as around 14% of the entire area of the facade). Regardless of the selected insulating material, the slips should not be fixed using random products (adhesives, mortars), as this may result not only in debonding of the slips, but also in damping the thermal insulation (wool), leading to the lowering of its insulation properties.

Slips on single (non-insulated) wall

In the case of single (non-insulated) walls with poor ventilation, high humidity and no transition layer in the form of thermal insulation that would retain moisture on the internal (warm) side of the wall (Fig. 4, 5), we recommend fixing the slips directly to the wall, using specially prepared adhesive and mortar systems. One can also use a ventilated casing made of waterproof OSB panels fixed to the wall with a framework (e.g. aluminium framework). Application of unproven fixing systems may lead to the disturbance of the steam diffusion process inside the wall, and thus to the condensation of the steam on the adhesive-slip border. This may result in debonding of the slips after freezing (sub-zero temperature zone).

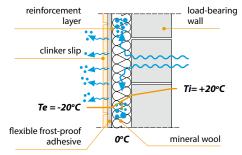

Fig. 2 Moisture transport and temperature distribution in a non-ventilated wall insulated with wool (system solutions)

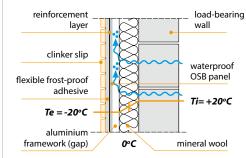

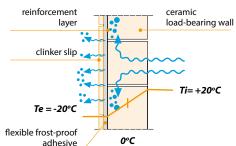

Fig. 3 Moisture transport and temperature distribution in a ventilated wall insulated with wool (alternative solutions)

Clinker and handmade **BRICKS and SLIPS**

FACADES and INTERIORS – slip laying

Rules of proper application of clinker slips in the interiors

The interiors are another area of application of clinker slips with all their advantages (durability, timelessness, damage resistance, lack of periodic restorations). Slips or even slip elements in the form of small sections can emphasize the nature of the interior and make it much more attractive. While fixing clinker slips inside the building, one should follow the same procedure, as in the case of ceramic slips (bathroom slips).

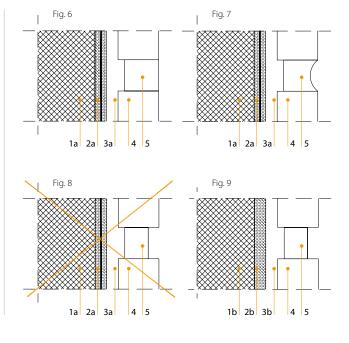

Only the method of pointing is different – we do not spread the mortar on the slip face, but fill the gaps between the slips with a semi-dry (consistency of damp soil) mortar for pointing. We do this with a pointing trowel. Only in the case of interior cladding can we can apply the recessed joint.

Formation of the joints

Outside, we recommend forming the joint to the face of the slip (Fig. 6) or rounding it (Fig. 7). Recessed joints (Fig. 8) are not recommended, as the formed ledge will collect dirt and damp, which may result in the occurrence of weeping, efflorescence or even debonding of the slips.

Formation of joints set back in relation to the facade plane is acceptable in interior cladding (Fig. 9). For pointing, use a pointing trowel, the width of which corresponds to the width of the gap between the slips. Fill the joints in a downward direction. First form the horizontal joints and then the vertical ones.

> 1a – brickwork element, 1b – load-bearing wall 2a – reinforcement mesh, 2b – plaster 3a – flexible frost-proof adhesive, 3b – flexible adhesive 4 – facade slip, 5 – joint

Answers to frequently asked QUESTIONS can be found on page 91

FENCINGS – post caps

A fence is a construction, which in addition to its primary function - providing privacy and separating the house surroundings from a road or another plot of land, also plays a representative role is often a showcase of its owners.

The form, materials and colour of the fence should refer to its surrounding elements. This can be achieved in many various ways, for example if the pattern of spans is similar to the railings of the stairs or balconies, and the posts and low walls are finished with the same materials as the wall or base of the house.

When building the fence, you should remember that:

- a building permit is not required to build a fence, but in the case of a fence bordering on a public street and road, you are obliged to report this fact to a competent authority 30 days before the works can be commenced,
- a fence between the neighbouring plots of land does not require notification, if its height does not exceed 2,2 m,
- a fence must not go beyond the borders of the plot,
- a gate and a wicket must not open to the outside, they should not have thresholds hindering a passage for the disabled,
- a wicket should be at least 90 cm wide and a gateway at least 240 cm.

MORTARS – masonry mortars with trass

A proper selection of the mortar ensures durability and aesthetics of the bricks, slips and the entire construction. So what are the features of a good mortar for clinker products?

One of the most significant features of each and every mortar is adhesion and permeability. It should not only join the bricks and slips in a stable masonry construction, but also form a barrier to prevent water from penetrating the brickwork. If the water does get inside (e.g. after heavy rain or due to microleakage), the mortar should easily remove it outside the brickwork.

During the daily operation of the building, the brickwork is constantly affected by adverse weather conditions. Changes in the temperature or humidity (and consequently linear changes in the brickwork) lead to the occurrence of stresses. Even in such extreme conditions the mortar should serve its function – it should not crack or lose its adhesive properties. It is essential to ensure leakproofness of the brickwork (protection against rain, snow) and to prevent it at the same time from salt efflorescence.

Trass added to the masonry mortar gives it the following advantageous properties:

- it binds the calcium compounds and makes the structure more leakproof,
- it considerably reduces the risk of occurrence of calcium efflorescences and discolorations on the joints and the brickwork,
 it fills in the pores,
- it significantly increases the mechanical strength and elasticity of the mortar,
- it improves workability,
- it prevents the batched water from entering into the bricks.

Remember:

- to select a masonry mortar adjusted to the degree of absorbability of the bricks,
- to follow the instructions on the dosage of water to the mortar,
- not to work in extreme weather conditions (in the direct sunlight, in the rain or in low temperatures).

Technical data concerning CRH Klinkier - Clay Solutions masonry mortars:

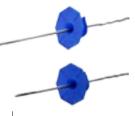

- intended use: low water absorption bricks (below 6%),
- type: ready for use, with addition of trass,
- bag weight: 25 kg,
- consumption: 40–50 kg for 1 square meter,
- available colors: grey, graphite.

Product availability: in constant offer.

ACCESSORIES – for clinker products

- Screw-in anchors with pressing disks (25 cm and 30 cm)
- Hammer-driven anchors with pressing disks (25 cm and 30 cm)
- Ventilation boxes (grey, graphite, black)
- Masonry reinforcement ladder mesh 4/50 mm
- Low stay (40 mm) and high stay (170 mm) reinforcements
- Joint filler tape 9-15 mm (length 3.3 m)
- Expansion plug

Screw-in anchor and hammer driven anchor

Ventilation boxes

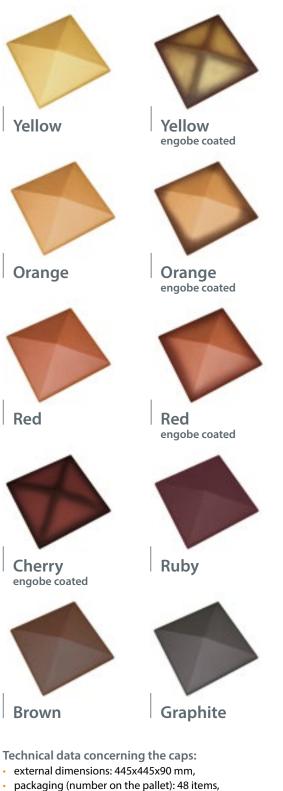

Low and high stay reinforcements

Joint filler tape

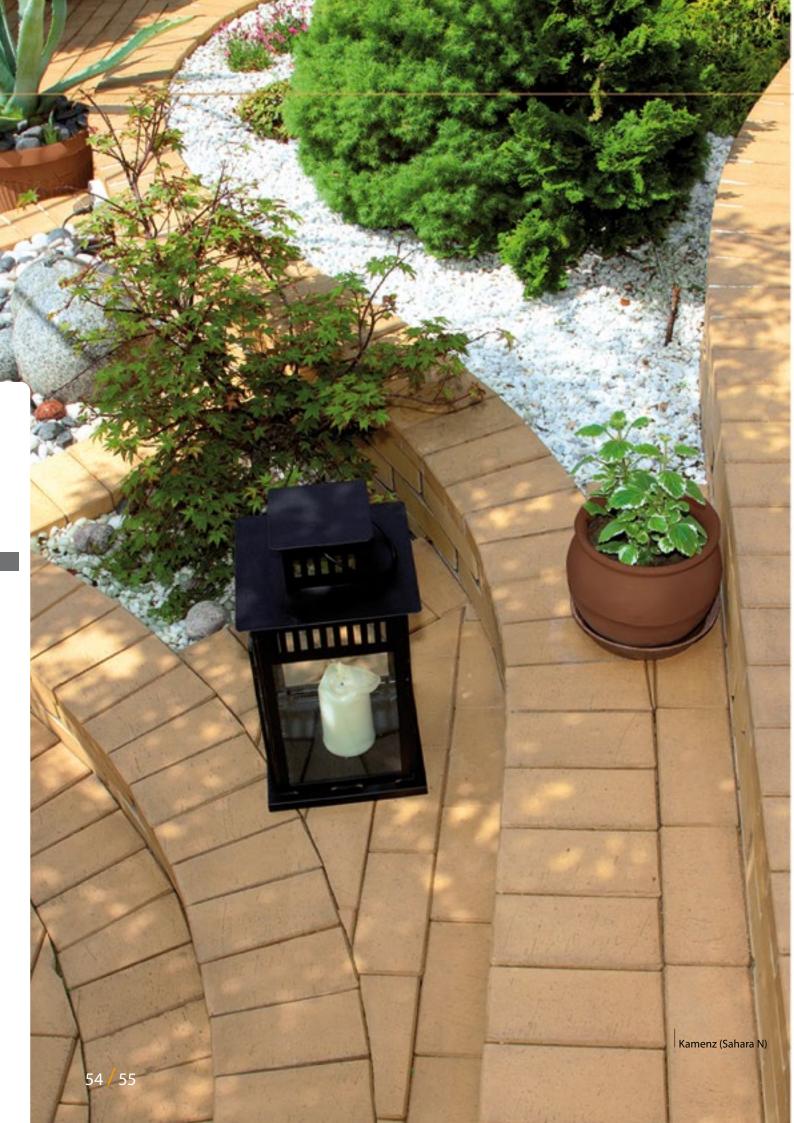

CAPS – for post 380x380mm

- •
- manufacturer: Gliwice,
- available colors: see photographs above.

Product availability: in constant offer.

CLAY PAVERS FOR ALL WEATHER CONDITIONS

Calau 45 (Etna N)

While building a house, one cannot forget its exterior design. The pavements, fencings and greenery are like stylish accessories to designer clothes. They should not be underestimated or chosen without due care and attention. They should not only reflect our individuality, but also harmonize with the surroundings. The CRH clay pavers are made of clay and sand. So they are naturally connected with the surroundings. The colours are inspired by the sun, water and ground. They are beautiful and extremely durable. Thanks to a rich palette of colours, they blend perfectly into small gardens and prestigious spaces. They do not require any special maintenance. The rain washes away the dirt, while the sun dries them out and highlights their colours. It is an aesthetic solution for every taste and weather conditions.

CRH Klinkier - Clay Solutions

Classic

WHY CHOOSE CLAY PAVERS?

• They do not fade or become abraded. Their colours are always beautiful and vivid (life-long colour warranty).

GRH

AY SOLUTIONS

- They do not require any special maintenance. The dirt is washed away by rain.
- It is possible to take out a clay pavers, turn it or move it to another position, as it is not permanently fixed to the ground. A clay paver has five possible faces that can be used.
- Their resistance is four times higher than that of concrete bricks (clay paver of thickness of 45 mm = 80 mm of concrete paving bricks).
- They are durable (the highest class of abrasion resistance up to 40 times lower than that of concrete paving bricks).
- They are environmentally friendly made only of clay and clean washed sand, without any artificial additives, admixtures or dyes.
- They are placed loosely on the gravel sub-crust. They do not require any screed, anti-humidity insulation or any other arrangement (finishing) materials.
- They have long-lasing, natural colours in the entire cross-section – a wide range of colours can be combined and arranged in various compositions, including arches and circles.
- They combine well with stone, wood or the garden greenery.
- They are perfect for any climate (even mountain and costal one) and for all seasons of the year.

WHY CHOOSE CLAY PAVEMENTS?

Meißen (Tytan N)

Q

Material: ceramics

Clay fired at 1110 °C. Ecological material – natural and durable.

Resistance: very high

The resistance of 45 mm thick CRH clay pavers is 4 times higher than that of 80 mm thick concrete paving bricks, because during the firing process the moulded and compressed clay forms ceramals, which guarantee high resistance of the material – 200 MPa. It is a multi-purpose material – it can be used for paths, terraces, driveways, streets, car parks etc.

Colour: durable and resistant to fading

Uniform across the entire material. A wide selection of colours is obtained by using various clays, which fire naturally into several colours without any artificial additives or dyes. Life-long colour warranty.

Number of surfaces and application segments: 5

5 possible surfaces of a single clay paver (2 flat surfaces + 2 end faces + 1 side face). Since the side faces of the clay paver are smooth, they can be used for the finishing of edges, curbs, stairs, low walls and other elements of the landscape design. Thus one can economize on additional finishing materials.

Skid resistance: the highest (U3 class)

The highest skid resistance under all conditions (dry and damp surfaces), because its surface does not become polished during the normal use. Operational safety.

Abrasion resistance: the highest (A3 class)

The average amount of material abraded during the tests according to PN EN 1344 should not exceed 450 mm³ (a clay paver measuring 200 x 100 mm can be abraded in the test only by 0.025 mm). Up to 40 times lower abrasibility, because clay paver is a ceramal and it is difficult to separate and abstract single grains from it, which is why it abrades hardly at all. Durability and elegance for years.

Resistance to weak acids: resistant

Resistance to weak acids, e.g. lemon juice or vinegar, is a natural feature of ceramics, because during the firing process the clay used to produce clinker changes its structure into a non-reactive form. Therefore, it becomes resistant to acids, detergents and other caustic agents. Easy maintenance and resistance to stains.

Prepared based on: PN-EN 1338:2005 "Concrete paving bricks. Requirements and test methods", PN-EN 1344:2004 "Ceramic road brick. Requirements and test methods" and data sheets issued by paving brick manufacturers.

PATOKA clinker for the connoisseur Clinker bricks and slips

RENOVATIONS and more ...

Patoka boasts a unique kiln, which is one of the last of its kind in the world, and in which exceptional bricks and clay pavers are fired. The uniqueness of the products results by no means from sorcery or magic spells (although, no one knows for sure ...). It is the traditional production process, unchanged for centuries, which gives the clinker its unique features, unobtainable in modern plants.

CLINKER FOR THE CONNOISSEUR

The unusual aesthetics and proven quality of Patoka clinker result from the original firing technology. The firing process takes place in a traditional coal-fired Hoffman kiln - one of the few of its kind in the world. The bricks and clay pavers fired in the kiln are characterized by unique colours and physical properties. Their exceptional aesthetics is valued by the investors and architects alike. A wide range of colours (from red to graphite) and deslagging enable one to design unique facades.

The Patoka brick factory also produces special bricks used to renovate historical buildings or perform restoration works. The clinker from Patoka can be found, among others, in the Wawel Royal Castle, Jasna Góra Monastery, Warsaw Barbican or the Malbork Castle.

QUESTIONS and ANSWERS

Why do clinker bricks of the same type vary in shades and sizes? Is it a defect?

 no, it is not a defect. Clinker brick is a natural product made of clay and sand, fired at 1100°C, and everything that's natural differs. This is what the value of the clinker products is all about

 it is not uniform and "plastic". Some variations in colour or size may occur between particular production batches, as a result of e.g. extraction of clay from various deposits or changeable weather conditions prevailing during the clay storage process. Therefore, when building a particular facility, we recommend using clinker bricks from one production batch and mixing bricks from various pallets. This way, one can achieve an interesting play of colours and smooth away the difference in the size of the bricks.

What is the permissible thickness of the vertical and horizontal joints for clinker bricks?

 according to the building practice and recommendations of § 6.3.1 of the PN-B-03002 standard of 1999, the thickness of bed joints (vertical and horizontal ones), made with the application of standard and light mortars, should not be less than 8 mm and should not exceed 15 mm. It should be remembered that due to slight differences in the size of clinker bricks and tiles, the thickness of the joint should not be the same along the entire facade (e.g. always 10 mm). A professional constructor can manage the arrangement of the bricks/slips with the thickness of the joint. It is not a mistake, but a good practice which enables one to maintain a natural and, 'non-plastic" nature of the facade.

Why does sand spill when holding a handmade brick?

• presence of a loose layer of sand on handmade bricks is not an accident. The sand coat is placed there on purpose, as it protects the brick during stacking, transportation and laying process. These bricks are characterized by a slightly lower resistance and increased absorbability, compared to the clinker material, so they are more likely to break or get dirty. It often happens that during the bricklaying or pointing works, the constructor accidentally soils the face of the manually moulded brick with the mortar. Once the works on the construction of the facade have been finished, the constructor should brush the entire surface (in a downward direction) to remove the sand grains covering the bricks and the stains developed during the works. This will guarantee a clean and beautiful facade.

How to fix the clinker slips? What kind of insulating material should one choose?

 the slips should be laid only on foamed polystyrene insulation. The recommended type of foamed polystyrene is EPS 100 (former name FS 20). The foamed polystyrene should be reinforced with an acrylic mesh dipped in an adhesive for mesh and then fixed to the load-bearing wall with metal pin anchors in the number of 4 items for 1 square meter (the wall anchors carry the shear loads and the load the entire facade – the adhesive itself would not be enough). The slips should be laid on this substrate, using highly flexible frost-resistant adhesive applied both to the wall and to the surface of the slip with a notched trowel made of stainless steel.

Won't the clay pavers lose their colour during normal use – won't they fade or abrade?

 clay pavers will not lose their colours because they are natural and durable products fired at a very high temperature. They have the same colour in the entire cross-section – not only on the surface of the brick – as a result of using clays firing naturally into various colours. A clay paver is made of clay and sand fired at 1100°C, so the colour is the same across the entire structure of the brick. The clay paver is a ceramal and it is difficult to separate and abstract single grains from it, which is why it abrades hardly at all.

Can the 45 mm clay paver be used for a driveway for passenger cars?

yes, of course. Despite its small thickness, this brick has enormous resistance (200 MPa, i.e. 4 times higher than that of the 80 mm thick concrete paving brick). However, one should bear in mind that in order to carry the loads, the surface needs to be placed on a resistant and rigid substrate. If the driveway is built on a stable and firm substrate, heavier vehicles (delivery trucks, delivery vans, etc.) will be able to drive on it, too.

Does one need to use cement for better stabilization of the substrate, while building a clinker driveway to the garage?

• there is no such a need. The pseudo – concrete slab under the clay pavers, after the process of setting, has poor bending strength and can crack under the weight of the vehicle, losing its properties. Additionally in the cement (as it is quite often metallurgical cement) one can find a large amount of different chemical compounds and additives. Once they get damp, they may cause efflorescence and discolouration. Although the above compounds do not affect the quality of the material, they do have an impact on the aesthetics of the final result. It happens that in some regions of Poland crushed-stone aggregate or all-in aggregate are not available on the market, so it is necessary to apply cement for additional stabilization of the substrate, but even then it is better to use it in deeper layers and not in the immediate vicinity of the clay pavers. This will minimize of occurrence of efflorescence.

Is it necessary to leave gaps, spaces between the clay pavers?

 yes, the gaps or spaces are necessary. They don't need to be big (2-3 mm is enough), however one must not "squeeze" the material. Clay pavers (like any other material) may change their size under temperature, and any elongation of the material may generate additional surface stress. As a result, the weakest elements of the construction, i.e. the edges, may be damaged. Small gaps between clay pavers enable one to avoid stress and they guarantee perfect condition of the construction and material for many years to come.

Terra Vesuvio

Mooi

The **CRH plc concern** was established in Ireland in 1970. Today it is a world leader in the building materials industry. Throughout its almost forty years of history, the company has extended its territorial scope of activities to 35 countries - it is present in the USA, Canada, Chile, Western Europe, Poland, Ukraine and China.
